1 MCP Providers Used by the Claude Financial Services Reports

Date: May 12, 2026

This document updates the earlier provider report for the May 2026 Anthropic financial-services release. It separates three different concepts that are easy to blur together:

1. The shared MCP connectors explicitly wired into the open-source manifests
2. The partner-built workflow packages shipped in the public repo
3. The broader ecosystem partners announced in Anthropic's May 5, 2026 finance-agents article

1.1 The Stable Shared Connector Baseline

Both the local financial-services-plugins repo and the inspected upstream Anthropic financial-services repo expose the same 11 shared MCP connectors in the financial-analysis core plugin.

Provider	Manifest key	Primary role
Daloopa	daloopa	Document-linked extraction of financial statement line items
Morningstar	morningstar	Investment data, fund intelligence, and research context
S&P Global	sp-global	Broad public-company, market, estimates, and transaction intelligence
FactSet	factset	Structured fundamentals, market data, and screening
Moody's	moodys	Credit ratings, outlooks, and risk commentary
MT Newswires	mtnewswire	Real-time news and catalyst flow
Aiera	aiera	Earnings events, transcripts, and management commentary
LSEG	lseg	Multi-asset pricing, analytics, curves, and fixed-income tooling
PitchBook	pitchbook	Private-market entities, deals, funds, and investors
Chronograph	chronograph	Private-capital portfolio monitoring and reporting data
Egnyte	egnyte	Internal documents, permissions, and enterprise knowledge access

1.2 What the 11-Connector Stack Actually Covers

The connector set works best if viewed as a layered workflow stack rather than a flat vendor list.

1.2.1 Facts layer

These providers answer the structured numerical questions:

- FactSet
- S&P Global
- LSEG
- Morningstar

Typical use cases:

- Trading comps
- Valuation inputs
- Consensus estimates
- Screening and peer analysis
- Historical pricing
- Macro and market context

1.2.2 Transcript and event layer

These providers answer what management, analysts, or the market actually said:

- Aiera
- MT Newswires

Typical use cases:

- Earnings-note drafting
- Catalyst tracking
- Morning notes
- Post-event synthesis

1.2.3 Source-linked model update layer

- Daloopa

Typical use cases:

- Turning filings into spreadsheet-ready inputs
- Auditing whether a modeled number still ties to source support
- Refreshing historical statement tabs

1.2.4 Credit and risk layer

- Moody's

Typical use cases:

- Ratings-aware financing analysis
- Capital-structure risk framing
- Credit commentary in memo or diligence workflows

1.2.5 Private-markets layer

- PitchBook
- Chronograph

Typical use cases:

- Sponsor mapping
- Private comps
- Deal sourcing
- Portfolio monitoring
- LP and GP reporting support

1.2.6 Internal knowledge layer

- Egnyte

Typical use cases:

- Pulling prior committee memos
- Reusing internal templates
- Accessing diligence archives
- Referencing firm-specific process documents

1.3 Provider-by-Provider Notes

1.3.1 Daloopa

Daloopa is best treated as a provenance-heavy extraction layer, not just a generic fundamentals feed. Its value is that line items are tied back to actual filings and source documents. That makes it especially strong for 3-statement refreshes, model QA, and any workflow where auditability matters.

1.3.2 Morningstar

Morningstar contributes a mixed research-plus-data modality. Compared with terminal-style public-market datasets, it is better for investor framing, fund and ETF context, ratings-style interpretation, and portfolio-aware discussions.

1.3.3 S&P Global

In the shared manifest, S&P Global is exposed through a Kensho-hosted integration endpoint. The practical effect is still a broad institutional facts layer: financials, prices, market cap, consensus, transactions, and related linked records. It is one of the main backbones for public-company coverage work.

1.3.4 FactSet

FactSet is another core structured data layer. It is the normalized numbers engine for public-market tasks where consistency matters more than source-document extraction: screening, peer sets, estimate context, historical pricing, and market snapshots.

1.3.5 Moody's

Moody's is the clearest credit-specialist layer in the shared stack. It becomes more important as the repo moves beyond equity research and investment banking into finance-ops, reconciliation, risk review, or compliance-adjacent workflows.

1.3.6 MT Newswires

MT Newswires is the immediate catalyst feed. It is less about archival depth and more about answering what just happened and why a name moved.

1.3.7 Aiera

Aiera is the words layer for earnings and investor communications. Its most useful feature is not just transcript availability, but machine-usable event metadata, speaker attribution, and citation-ready call detail.

1.3.8 LSEG

LSEG is the broadest multi-asset and analytics-heavy provider in the public stack. It extends beyond simple quotes into curves, fixed-income analytics, options, FX carry, macro series, and YieldBook-style bond analysis.

1.3.9 PitchBook

PitchBook covers the private-market landscape: companies, rounds, buyers, funds, investors, and transaction history. It matters when the universe is not confined to public issuers.

1.3.10 Chronograph

Chronograph is less about market discovery and more about private-capital operating data: portfolio monitoring, valuation workflows, and recurring reporting support. It becomes more relevant once fund-admin and valuation-review flows are introduced.

1.3.11 Egnyte

Egnyte is the internal memory layer. It makes the difference between a generic analyst workflow and a firm-specific one because it can surface prior internal outputs, approved templates, and controlled diligence materials.

1.4 Partner-Built Packages in the Public Repo

The public Anthropic repo currently ships two partner-built packages on top of the shared connector set:

Partner package	Focus
LSEG	Bond RV, swap curves, FX carry, option vol, fixed-income portfolio review, macro-rates monitoring
S&P Global	Tear sheets, earnings previews, and funding digests

These packages are not separate connector categories from the shared stack. They are deeper workflow wrappers around providers that are already part of the main connector baseline.

1.5 What Anthropic Announced on May 5, 2026 Beyond the Open Manifests

Anthropic's finance-agents announcement introduced a broader ecosystem story than the 11 wired connectors shown in the checked-in `.mcp.json` files.

1.5.1 Newly announced ecosystem partners

Partner	Stated value in the announcement
Dun & Bradstreet	Verified business identity and enterprise record-linking for AI workflows
Fiscal AI	Real-time public-equity fundamentals and benchmarking
Financial Modeling Prep	Quotes, fundamentals, statements, filings, and transcripts
Guidepoint	Compliance-reviewed expert interview transcripts
IBISWorld	Industry revenue, cost structure, risk, and forecast data
SS&C Intralinks	DealCenter AI data rooms, diligence Q&A, and deal tracking
Third Bridge	Expert interviews across companies, sectors, and value chains
Verisk	Insurance underwriting, claims, and risk-analysis data

1.5.2 Newly announced app surface

Surface	Stated role
Moody's MCP app	Interactive use of proprietary credit data plus coverage of 600M+ public and private companies

1.6 Important Distinction

As of May 12, 2026:

- These additional partners are part of Anthropic's public narrative.
- They are not yet reflected in the inspected upstream open-source connector manifests.
- The open repo still centers on the stable 11-connector baseline plus two partner-built packages.

That distinction matters for planning. A repo can be "aligned with the open manifests" while still not matching the full ecosystem breadth Anthropic is now marketing.

1.7 Implications for This Repo

1.7.1 What is already aligned

- The shared 11-connector baseline
- The LSEG partner-built package
- The S&P Global partner-built package

1.7.2 What should be treated as next-wave connector opportunities

Partner	Best matching future workflow area
Dun & Bradstreet	Operations and KYC
Guidepoint	Equity research and private equity diligence
Third Bridge	Equity research and private equity diligence
IBISWorld	Market-research and sector-primer workflows
SS&C Intralinks	Investment banking and private-equity data-room workflows
Verisk	Insurance and risk operations
Financial Modeling Prep	Broader public-markets coverage or lower-cost data coverage cases
Fiscal AI	Supplemental public-equity coverage workflows
Moody's MCP app	Credit-heavy finance, risk, and onboarding workflows

1.8 Bottom Line

The connector story is more stable than the packaging story.

- Packaging changed dramatically in May 2026: agents, cookbooks, and Microsoft 365 tooling
- The open shared connector baseline did not

That means the fastest way to modernize this repo is still to adopt the new workflow surfaces first, while treating the article-announced partner set as a second-wave roadmap rather than assuming those integrations are already represented in the open manifests.

1.9 Source Basis

- Anthropic financial-services repo inspected on May 12, 2026
- Anthropic “Agents for financial services” announcement published on May 5, 2026
